Abstract

Background: Funded health research is being published in journals that many regard as “predatory”, deceptive, and non-credible. We do not currently know whether funders provide guidance on how to select a journal in which to publish funded health research.

Methods: We identified the largest 46 philanthropic, public, development assistance, public-private partnership, and multilateral funders of health research by expenditure, globally as well as four public funders from lower-middle income countries, from the list at https://healthresearchfunders.org. One of us identified guidance on disseminating funded research from each funders’ website (August/September 2017), then extracted information about selecting journals, which was verified by another assessor. Discrepancies were resolved by discussion. Results were summarized descriptively. This research used publicly available information; we did not seek verification with funding bodies.

Results: The majority (44/50) of sampled funders indicated funding health research. 38 (of 44, 86%) had publicly available information about disseminating funded research, typically called “policies” (29, 76%). Of these 38, 36 (95%) mentioned journal publication for dissemination of which 13 (36.11%) offer variable guidance on selecting a journal, all of which relate to the funder’s open access mandate. Six funders (17%) outlined publisher requirements or features by which to select a journal. One funder linked to a document

providing features of journals to look for (e.g. listed in the Directory of Open Access Journals) and to be wary of (e.g., no journal scope statement, uses direct and unsolicited marketing).

**Conclusions:** Few funders provided guidance on how to select a journal in which to publish funded research. Funders have a duty to ensure that the research they fund is discoverable by others. This research is a benchmark for funder guidance on journal selection prior to the January 2021 implementation of Plan S (a global, funder-led initiative to ensure immediate, open access to funded, published research).

Amendments from Version 1

We have addressed/responded to the suggestions from reviewers with the following changes:
- simplified the wording/sentence structure in the introduction and discussion sections.
- clarified the relevance of this research to health research funders in the introduction (i.e., discoverability, uptake).
- added more detail on how extraction items were devised.
- acknowledged, in the limitations section, the potential benefit of engaging funders in the study process.

Any further responses from the reviewers can be found at the end of the article.

Introduction

Biomedical research studies supported by well-known funding organizations such as the National Institutes of Health (NIH), are published in so-called “predatory” journals. Predatory journals are regarded as non-credible and are criticized for failing to provide typical or expected publishing services and their lack of transparent operations. Such services include peer review, long term preservation of content, and indexing in scientific, bibliographic databases. Among their many shortcomings, the potential failure of predatory journals to ensure permanent discoverability of research threatens the integrity of the scientific record. Such research cannot contribute to science, thus wasting time, money, and resources. Even if discovered, the potential impact and uptake of funded research in predatory journals may be limited due to being published in a perceived untrustworthy source. While benefits from investments in research are difficult to quantify, one way funders measure returns on investments is by tracking research outputs, including scholarly journal publications. Predatory journals may limit returns on funders’ investments by undermining the intended promise of scholarly publishing – to enable the results of research to be known for others to build upon.

Health research funders ought to be concerned that the funds they provide may be wasted or contribute to research waste as a result of funded research being published in predatory journals. They may be supporting research that is not identifiable or able to be found if published in predatory journals, potentially wasting millions of dollars of research funding. When research is easily identifiable it can reduce unintentional redundancies in research efforts and investments. Additional wastage occurs when funder investments are used to pay for article processing charges (APCs). In biomedicine, research grants and national funding agencies are the largest source of funds supporting publication of at least 50% of open access articles.

Funders & open access

Most major health research funders mandate that funded research outputs be open access. Open access mandates typically require researchers to ensure that research (and sometimes data) is published in an open access journal or is deposited in a publicly accessible digital repository (regardless of whether the publication was published in an open access journal), or both. Some journals may impose an embargo period only after which an article is made publicly available or can be archived in a repository (i.e., delayed-access journals). Many funders’ policies allow for such delays in open access to accommodate publishers’ preferences.

Open access policies are one way for funders to direct funded researchers towards publishing in credible journals abiding by established open access tenets:

1. Research is/should be freely available and accessible to anyone.
2. The copyright accompanying published work should be open, allowing for free use and re-use (i.e., allowing research to be freely built on/adapted with attribution).

To facilitate researcher adherence with funder open access policies, many biomedical journals offering open access have agreements with the PubMed Central (PMC) repository to automatically deposit their published content on authors’ behalf. Additionally, researchers funded by the NIH and 13 partner funding organizations in the USA can upload funder-supported publications to PMC from journals without PMC agreements. Likewise, 29 funders from across Europe can submit funder-supported research to Europe PMC (which is mirrored in PMC). For some of these organizations, such as the NIH and Wellcome Trust, archiving in PMC or Europe PMC, respectively, is mandatory.

In a possible attempt to attract submissions, predatory journals appear to market themselves as “open access.” While research in them may indeed be free to access, discovery of their content in scientifically-curated databases is sparse and inconsistent. Predatory journal articles may haphazardly appear in search engines such as Google Scholar (which indexes anything that appears formatted as a scholarly article) or in PubMed (since it includes author-uploaded articles from PMC). Additionally, we do not know whether the contents of unindexed/archived journals will be perpetually available if a journal ceases to operate. Such preservation is typically achieved through journal/publisher agreements with digital preservation providers (e.g., Lots of Copies Keep Stuff Safe, LOCKSS). For journals indexed in Medline, for example, this is a prerequisite of indexing. PMC functions as a preservation service (i.e., has a remit to preserve content funded by public money). It is unknown whether predatory journals, not formally indexed in Medline, PMC, or other databases with similar requirements, have digital preservation arrangements.

Most researchers have a limited understanding of what open access means beyond making research free to read. Free use and unrestricted re-use of research is a fundamental component of open access, and licensing that permits this is a regular component of open access journals. Journals running nefarious and deceptive publishing operations have likely benefited from or exploited authors’ lack of awareness. Indeed, few
predatory journals mention licensing for articles or provide information on the use and re-use of published research⁶⁹. Without explicit licensing for published articles, the legalities around distributing or building on research in predatory journals, for example, is uncertain. Whether researchers are deceived by predatory journals or are knowingly seeking easy and rapid publications in them (these journals tend to deliver quicker turn-round time than credible journals due to subpar or non-existent peer review²⁸²⁹), they are likely breaching the open access policies set by their funders.

In January 2017, the Bill & Melinda Gates Foundation implemented a policy mandating open access to research publications and data, without delay for all funded research⁶⁹. In February 2017, they initiated a one-year partnership pilot with the American Association for the Advancement of Science (AAAS) to enable Gates-funded research to be published as open access in five AAAS journals, including Science⁴¹. The Gates-AAAS partnership seemed to inspire several other influential journals (i.e., New England Journal of Medicine, Proceedings of the National Academy of Sciences) to introduce policies ensuring permanent open access for Gates-funded research⁵².

In January 2021, a number of international funders (including UK Research and Innovation, the Gates Foundation, Wellcome Trust, and the World Health Organization), led by Science Europe (a group representing funders across Europe), delivered a radical change to the way that funded research is published, via Plan S (coalition-s.org). Plan S, in part, requires research funders to mandate open access to funded research through publication in an open access journal or platform; requiring publications to be immediately available through an open access repository upon publication. To support this, agreed funders will pay the cost of article publishing charges (APCs) (up to a yet unannounced limit) to journals that are immediately and wholly open access (sometimes referred to as ‘gold’ open access).

Whether health research funding bodies, prior to Plan S, provide funded researchers with guidance or support towards selecting publishing journals in line with their policies and which facilitate proper (and permanent) access to research, and whether they monitor such policies, is unknown. Previous studies confirm that many non-commercial health research funders’ have policies requiring open access to completed research or results via publication or otherwise⁵³⁵⁴. Yet none seem to have assessed whether funders provide any specific information to researchers to facilitate their choice of publishing journal. For public or charitable funders, providing such guidance or support may be one way of ensuring responsible stewardship of public or donor funds. While research publication routes exist beyond scientific journals (e.g., preprint servers, repositories) the present project examines journals as the primary vehicles of research dissemination due to funders’ and academia’s reliance on them as a gauge of research impact/productivity. The current work will establish a pre-Plan S baseline of health research funders’ guidance on selecting journals in which to publish funded research.

The aim of this research is to describe the policies and recommendations of major health research funding bodies regarding suitable journals for funded research.

**Methods**

We considered the public websites of 50 health funding bodies for statements, guidance, or policies specifically mentioning the publication of funded research. Detailed methods and rationale for this study are elaborated in an *a priori* study protocol (https://doi.org/10.17605/OSF.IO/J6CSK) and summarized below.

**Data source**

Global funding bodies with the largest documented health research expenditures were sampled from the curated Health Research Funder’s list found at: www.healthresearchfunders.org⁴⁴. The list was developed as part of an unfunded post-doctoral project by researchers in the Netherlands⁵⁵. It was last updated in 2016; expenditure data are reported in 2013 US dollars (USD, accounting for inflation/deflation rates by country). A detailed account of the systematic process used to identify funders and obtain expenditure data is found here: http://www.healthresearchfunders.org/faq/. At the time of retrieval for this study (August 2017), 287 health research funding bodies from 30 countries were included on the list. The list distinguishes five categories of funders: [1] philanthropic funders (n=194), [2] public funders (n=77), [3] public funders who fund health research through Official Development Assistance (public ODA)⁷ (n=8), [4] multilateral funders (funding across countries) (n=7), and [5] public-private partnerships (PPP) (n=1) (Table 1). While there are some inequities in its coverage (e.g. public funders were selected from only G20 countries; paucity of funders from low income countries), the list is likely the most comprehensive source of global health research funder expenditure information in existence (personal communication, Dr. Beverley Holmes, CEO, Michael Smith Foundation for Health Research) and has been used to construct samples in at least two other studies⁴⁶⁴⁷. This study excludes commercial funders since their expenditure data are not publicly or readily available.

**Sampling**

To construct our sample, we sought up to 15 funders with the largest expenditures from each of the five funder categories from the list at www.healthresearchfunders.org, and aimed to include all listed lower income countries (n=4) if they were not otherwise represented in the sample. We included the latter group of funders in order to ensure representation from lower income countries, since researchers and journals from these countries have been disproportionately implicated in predatory publishing⁶⁶⁶⁷. Working with the available number of funders in each category (Table 1), we ended up with 50 funders: 15 philanthropic, 15 public, eight public ODA, seven multilateral, one PPP, and four lower-middle income country funders.

** Includes 1 funder with no expenditure data available.
†† Includes 5 funders with no expenditure data available.

In line with previous investigations into health research funder policies, we expected that guidance for funded researchers would be publicly available and easily obtained. For each included funder, one of us (LS) visited the website using the URL provided by www.healthresearchfunders.org, or if the URL was not working, found it through a Google search using the funder name. When a funder’s website could not be located/did not work or when the funder was a duplicate, the next largest funder on the list was used. For each funder, we sought and downloaded the website section on policies for funded research in August-September 2017. If no specific policies were found, we searched the SHERPA (Securing a Hybrid Environment for Research Preservation and Access)/Juliet database (www.sherpa.ac.uk/juliet/index.php), which lists and links conditions for open access publication for some funders (though this is incomplete as it is reliant on voluntary contributions from funders and other organizations [e.g., libraries] tracking funder policies). If a funder’s website did not mention funding health research (i.e., funded other scientific research) or if the funder did not specifically award grants for research, the funding body was excluded from the sample and replaced with the next largest funder (by expenditure), where possible. Reasons for exclusion are documented in Figure 1.

### Data extraction

One assessor (LS) extracted information from the downloaded policy documents into an online form in Distiller SR, and a second assessor (KDC or MJP) verified the extracted data. Discrepancies were resolved by discussion. If additional documents were identified during extraction, we saved them and searched them for the desired data. The verification process led to clarifications in collected data or provided additional information. Since no reference standard for funder policies on publishing exists, the extracted items were derived de novo by the study team; no formal consensus process was used. The following information was assessed or extracted, as available:

- Any statement(s) about the dissemination of outputs from funded research
- Policy or recommendations about publication of funded research
- Policies or recommendations on research/data accessibility
- Policies or recommendations on journal quality, impact factor or other metric, ethical standards, and indexing of funded research
- Whether/what information is provided to researchers about predatory or substandard journals, or about journal credibility
- Strength of any aforementioned policies/recommendations (‘must’, ‘should’, or ‘suggested’)
- For publication policies, whether adherence will be monitored
- For publication policies, whether consequences of non-adherence are listed

If non-English websites or documents were encountered and an English-language version was not available on the website, Google Translate was used to automatically translate the websites and documents. Google Translate has recently shown 85%–97% accuracy across nine languages for translating health research studies, including the languages encountered in this study (French and German).

### Data analysis

We summarized data descriptively by calculating proportions for dichotomous data; the date of funder policies/recommendations was summarized as medians and interquartile range.
Protocol deviations

In the protocol for this study, we stated that we wanted to determine whether there were differences in the number of funders with policies/statements about journal quality and predatory publishing based on the income-level of the funder country or country being funded. However, as only four funders from lower-middle income countries and none from low income countries were on the list we sampled from, there were not enough funders to enable meaningful comparisons between higher income and lower income countries.

Results

For the 50 funding bodies originally identified using the described sampling technique, three allocated money from a funder (European Commission) already in the sample and were replaced with the next organizations on the list. One of the replacement funders also allocated money from an included funder and was also replaced. Two funders funded non-health research and four funders did not list any research grants (and appeared to fund health development initiatives) and could not be evaluated for our purposes. Overall, six funders were excluded and lacked replacements in the categories they belonged to. 44 funders remained in the sample for which grant policies and guidelines were sought (Figure 1). 35 funders are from high income countries, one from upper-middle income (China), three are from a lower-middle income country (India), and five are not classified by income level because they are multilateral (n=3) or fund across the European Union (EU) (n=2, Table 2).

38 of 44 funders (86%) had publicly available information for grantees about disseminating funded research outputs (Table 3). Of the six funders that did not have publicly available information, five are from high-income countries (US, Germany, France, UK) and one funds research in the EU through public-private partnership. Three are philanthropic organizations and

---

2Any European Commission funding program that explicitly stated using the European Horizon 2020 guidelines for grantees were jointly represented as “European Commission”. (Figure 1)
two are public-ODA funders. Information about disseminating research was contained within “policies” for 29/38 (76%) funders, “recommendations” (suggestions and guidance) for 8/38 (21%) of funders, and as a “code of conduct” for one funder (Table 3).

Over a third of policies/recommendations also specifically mentioned the dissemination of “data” (25/38, 66%). The median implementation date or date listed on collected documents was September 2014 (IQR: Apr 2012 to Apr 2016, n=35).

Open access and journal selection
36 of 38 policies/recommendations (95%) specifically referred to publication in a journal as one form of dissemination for completed research (Table 4). 31 of these (86%) mentioned that research should be open access, either through journal publication (n=24, 77%) or through self-archiving the final report or accepted manuscript in a freely accessible repository (such as PMC) (n=30, 97%). One funder from India (Indian Council of Medical Research), one from France (Institut National de la Santé Et de la Recherche Médicale, INSERM), and three from the USA (US Department of Defense, Congressionally Directed Medical Research Program, and the American Cancer Society) did not mention open access in their policies about research dissemination.

13 of 36 (36%) policies recommending publication contained some guidance on how to select a journal and six (17%) listed features or requirements of publishers or journals for researchers to look for (Table 5). These six are described here. Only one funder policy (NIH) included a definition of a journal (i.e., either a publication listed in the journal section of the National Library of Medicine or one meeting stated criteria). And only one funder policy (Canadian International Development Research Council, IDRC) appeared to provide any information about ‘questionable’ journals in a guidance document entitled “Publishing in Open Access Journals”. The document lists journal features to “look for” and to “be wary of” and mentions Beall’s List as a resource (Table 5). One policy (Deutsche Forschungsgemeinschaft/German Research Foundation, DFG) linked to Think, Check, Submit (https://thinkchecksubmit.org) – an initiative to facilitate researchers’ assessment of the credentials of a journal – on a page supplementing their open access policy listing open access resources. Two funders distributing APC fees through the Charitable Open Access Fund (Cancer Research UK and Wellcome Trust) list the

---

Beall’s List is an archived listing of potential predatory journals and publishers, as determined by librarian Jeffrey Beall between 2011 and 2017, https://web.archive.org/web/20170103170903/https://scholarlyoa.com/
requirements of journals whose APCs are eligible for payment through the fund. The Bill and Melinda Gates Foundation provide researchers with a portal (called Chronos) through which to submit manuscripts directly to pre-selected journals whose standards are in line with their requirements.

The policies of at least three funders (German Federal Ministry of Education and Research Indian [BMBF], Indian Department of Biotechnology [DBT], Indian Department of Science & Technology [DST]) include a statement that further to making research freely accessible, researchers’ choice of journal was unrestricted.

**Other journal characteristics mentioned by funders**

Most funders mentioned that funded research should be peer reviewed or published in a peer reviewed journal (Table 4). Four funders made non-specific reference to selecting a “good” or “quality” journal in relation to publication of funded research; none mentioned the journal impact factor. Eight funders made statements about publication transparency or ethics. For instance, one funder discussed reproducibility in published research, three mentioned adherence to reporting guidelines, and at least six asked that metadata accompany published articles (Table 6).

**Adherence to policies/recommendations**

Of 38 policies/recommendations providing information about disseminating research outputs, only nine (24%) stated that they monitor adherence to either a policy (n=7) or recommendation (n=2); two philanthropic funders (Wellcome Trust and Bill & Melinda Gates Foundation) specified that they would evaluate publications of funded research reported to them to ensure they are published in journals meeting the funder’s outlined publishing requirements (Table 7). No monitoring or adherence data appears to be publicly available. Only five (13%) funders with policies or recommendations about journal publication indicated that there would be consequences for non-adherence. And only two of those (Wellcome Trust and NIH) stated that they would withhold or suspend payments if articles are not made open access.

**Discussion**

Most health research funders appear to have active policies about the dissemination of funded research, typically about open access which often include statements about journal publication. Few policies contain guidance on how to select journals, list features of journals meeting funder requirements, or about the credibility of publishing outlets. Only one health research funding organization (IDRC) made specific reference to the “questionable journals” at the time of data collection (August-September 2017). Additionally, few policies describe whether funded outputs are monitored for compliance with funders’ dissemination policies, and few describe any consequences for researchers’ non-adherence to their policies. Information is not available on whether the NIH or Wellcome Trust, both of whom promise to withhold or suspend grant funds for breaching their open access policies, have actually ever done so.

For many of the funders in our sample, information to guide research publication was found across multiple documents and not always within open access policy statements/documents where publication is mentioned. For example, the only guidance we identified that referred to predatory journals (IDRC) was contained in a PDF (entitled “Publishing in Open Access Journals”) separate from the funders’ main open access policy. The policy did not flag that the document contained information about predatory/questionable/non-credible journals. This unobvious placement of guidance or expectations around journal selection relies on researchers’ curiosity or knowledge that important

<tr>
<td>Cancer Research UK</td>
<td>“The journal you publish in must be published by a publisher who has agreed to the COAF/Wellcome Trust publisher requirements. Cancer Research UK and the Charity Open Access Fund (COAF) will only fund APCs where the publisher has agreed to the COAF/Wellcome Trust publisher requirements. These publisher requirements set out the open access services that publishers must agree to provide when they charge APCs for COAF-funded researchers. Most major publishers and many smaller publishers have signed up to these requirements. If you would like to check that the publisher of your chosen journal is compliant, search the SHERPA/FACT database here. Select the name of the relevant journal and Cancer Research UK as your funder – as long as the results show at least one ‘tick’ (√), the journal is compliant by that route.”</td>
<td>“Publishers who want to provide open access publishing services for Wellcome and Charity Open Access Fund (COAF) grantees through peer-reviewed journals based on article processing charges (APCs) must commit to providing a service that meets our requirements. Our open access policy (funding/managing-grant/open-access-policy) states that when Wellcome funds are used to pay an APC, the article must be deposited, at the time of publication in PubMed Central (PMC). It will then be mirrored to Europe PMC. All deposited articles must be made available under the Creative Commons Attribution (CC-BY) Licence. COAF follows the same policy. Wellcome and COAF’s open access policies and requirements are designed to maximise the availability and reuse of publications. We hope that publishers will continue to support us and our grantees in this endeavour. We recognise that relationships in the publication process are not straightforward – we have grant-funding relationships with researchers, who then establish relationships with publishers. This can lead to confusion about what Wellcome and COAF expect from publishers. Our requirements clarify the service that publishers who receive Wellcome or COAF funds need to provide.”</td>

information may be located outside of the main policy webpages or documents. If funders wish to provide guidance about journal credibility and predatory publishing, they may reach more researchers (and increase the likelihood of them reading it) by including such information within their main policies.

**Comparison to other research**

At least four previous studies examining health research funder policies on clinical trial transparency have collected information on funder’s recommendations for disseminating research.

Two studies using similar methods evaluated trial transparency policies (i.e., those related to trial registration, access to summary results, individual data availability) for non-commercial health research funders globally (n=18) and in the USA (n=9). After accounting for three common funders across studies, 21 of 24 (87.5%) funders (16 of which are represented in our study) either required or supported publication or registration of trial results (neither study or their available data distinguished between publication or registration). This is in line with our findings in which 86% (38 of 44) funders had such policies/recommendations.

A third study, published in 2017 which examined research waste-reducing policies of 11 non-commercial funders (six of which are represented in our study) reported six to be explicit in requiring publication of full reports of funded research. In comparison, 36 of 38 policies/recommendations (95%) in our study referred to journal publication as one form of dissemination for completed research but did not indicate that it was mandatory. There may be differences in how authors of that study and interpreted language in documents or policies. The names of the six funders ‘requiring’ publication in that study were not obvious in either the publication or available data, so we are unable to investigate this further.

A study published in 2008 examined 73 UK and international non-commercial health research funders’ guidance for reporting funded clinical trials. 49 funders (67%) explicitly stated that trials could or should be published. Of the three funders appearing in the 2008 sample and ours, all have maintained recommending (but not requiring) the publication of trial results. Whether funders provided any guidance on selecting a journal to publish in was not collected in the study.

No previous studies appear to have investigated whether health research funders’ provide guidance to help funded researchers select a journal for publication. Our study appears to be the most comprehensive investigation on this matter. This is surprising since our findings suggest that funders in our sample regard publication as the primary means of disseminating funded research. Further, studies show that researchers view journal publication as the primary way of disseminating research.

**Strengths and limitations**

This study is the first to examine the information funders provide researchers about selecting a journal in which to publish funded research. All funders in our sample that mention journal publication or provide guidance on selecting journals, do so within their open access policies. In a time where the scholarly publishing landscape has been infiltrated and confused by predatory journals, inadvertently resulting in some researchers trying to achieve open access to publish in predatory journals, funders can play a critical role in steering researchers in the right direction. Funders can be specific and explicit with regards to which journal features researchers should look for in order to select one that meets their open access requirements.

This study provides a benchmark by which to monitor how major health research funders are performing pre and post Plan S implementation (January 2021). Data collection occurred in August & September 2017, prior to the September 2018 announcement of Plan S. So far, 24 funders have committed to implementing Plan S, five of which were considered in this research (European Commission, Gates Foundation, MRC/UK Research and Innovation, Wellcome Trust, and the World Health Organization). Two of these, the Wellcome Trust and Gates Foundation, provided guidance (in the form of tools) to facilitate selecting a journal in line with their open access policies at the time of sampling. At least one funder (Wellcome Trust) has made changes to their open access policies in anticipation of Plan S.

Our study relied on publicly available information about funder expectations of funded research and was abstracted by a single person with verification by a second (i.e., not two independent people). Six funders in our sample did not provide any relevant public information. We did not seek verification on policies from funders. Data were collected at a time when publishing activities, particularly open access, was rapidly changing, in part in response to funded research being published in predatory journals. We are aware that the NIH issued a notice on their Public Access Policy in November 2017 (outside of our sampling and data collection period) with recommendations to publish funded research in journals with ‘credible practices’. Engaging funders in our study may have had the added benefit of increasing uptake of our findings/recommendations into practice.

The focus of this research is limited to health research funders. We have not accounted for or evaluated other potential scientific publishing gatekeepers such as academic institutions, governments, or companies carrying out scholarly research, despite the important role they can play.

**Implications and recommendations for funders**

Explicit funder policies on publication expectations. Selecting a journal in which to publish research is not a straightforward undertaking, particularly since the emergence of predatory journals. For funders looking to make their expectations around publishing funded research more explicit and more transparent, we propose several recommendations on how this might be achieved in Box 1, based on findings of this research and on the expertise of authors. Providing specific information about journal considerations in funders’ policies to funded researchers may facilitate more thoughtful and responsible selection.
of journals. Several recommendations in Box 1 pertain to the explicitness of article/journal considerations mentioned in Plan S (e.g., persistent identifiers for publications; long-term preservation/archiving; article-level metadata). All health research funders may wish to consider making aspects of their policies that pertain to publishing more explicit, whether or not they intend to implement Plan S.

### Box 1. Recommendations for providing explicit/transparency guidance on journal selection in health research funders’ open access policies

1. Use precise wording to describe your agency’s expectations that funded research be published
   - Indicate whether researchers are expected to publish their research (e.g. use of “must” vs “should”)
   - Indicate whether open access publication is one of several options for meeting the agency’s open access requirements.

2. Provide a definition of a journal that is suitable to your agency
   - Decide what essential features a publishing entity should and should not have in order to be considered a suitable place for publication.
   - Consider referring to/including the Committee on Publication Ethics (COPE) list of Core Practices all journals and publishers should follow: https://publicationethics.org/core-practices
   - The NIH definition of a journal is:
     - Publication meets the requirements for ISSN (International Standard Serial Number) assignment;
     - Publication content is issued over time under a common title;
     - Publication is a collection of articles by different authors;
     - Publication is intended to be published indefinitely.

3. Indicate your agency’s requirements for access and discoverability of published articles
   - Distinguish between free vs open access:
     - Published articles are free to access; AND additionally, for open access,
     - Licensing for published articles permit reuse and building on (typically through a Creative Commons Attribution License, CC BY).
   - Ensure that published research can be accessed in perpetuity
     - Researchers can determine whether the publishing journal has a permanent archival arrangement in place either through automatic deposition to PMC (https://www.ncbi.nlm.nih.gov/pmc/journals/), or to another archive (via the Keepers Registry: https://keepers.issn.org/keepers-registry)

4. Be clear about your agency’s support for article processing charges arising from publication of funded research
   - Indicate how much money is available each open access publication (e.g. maximum APC amount)
   - Indicate who will receive APC payment from the funder – the author (institution) or the journal
   - Indicate when funding will be distributed to support article processing charges
   - Indicate whether there are any conditions on distribution of APC funds

5. Indicate whether your agency requires archiving in a repository alongside publication
   - Indicate whether the publication, data, or both, are expected to be deposited in a repository
   - Indicate when deposition is expected to occur (i.e., immediately or within a specified time frame)
   - Indicate whether you have a dedicated repository for research publications (e.g., PMC for NIH-funded research), and if not, suggest one or more repositories that are considered acceptable by your agency
   - Be clear that it is the authors’ responsibility to ensure publications are deposited in a repository
   - Provide instructions/link to resources on how to deposit research in the suggested repository.

6. Indicate how your agency will monitor that funded research is published in appropriate journals, in line with agency recommendations/mandates
   - For ease of monitoring, Provide instructions for researchers about where and how to include the funding agency name and grant number in published articles (guidance here: https://www.ukri.org/wp-content/uploads/2020/10/RIN-251020-FundersAcknowledgementInScholarlyjournalArticles.pdf)
   - Provide instructions on if, how, and when to submit publications of funded research to the funding agency, or state how publications will be monitored otherwise
   - Provide specific actions/consequences that the agency will carry out when funded research is published in a journal that does not meet agency requirements

**The NIH is the only funder in our sample to clearly describe what it considers a journal – either those listed in the journal section of the National Library of Medicine (NLM) (https://www.ncbi.nlm.nih.gov/nlmcatalog/journals) or those meeting a comprehensive set of criteria: (1) meets the requirements for ISSN (International Standard Serial Number) assignment; (2) content is issued over time under a common title; (3) is a collection of articles by different authors; and (4) is intended to be published indefinitely. All but the final criterion are straightforward to judge;"
presumably it is meant to distinguish a journal from a book or a monograph however NIH or NLM do not provide guidance on how to judge this criterion. Whether and how we can predict journals’ intentions to publish indefinitely has not been described. A more meaningful criterion for distinguishing journals from non-journals may be whether the publishing entity has archival arrangements in place (e.g., with LOCKSS, Portico, PubMed Central) to ensure perpetual access to content in the event a journal ceases to operate. Since preserving publisher content may have associated costs, predatory or non-credible journals (which some describe as “primarily fee-collecting operations”) may be unlikely to seek this service.

We surprised that the three funders from India in our sample (Indian Council for Medical Research, DBT, and DST) did not mention journal credibility or predatory journals, and further, that a common policy for two Indian funders (DST and DBT), dated December 2014, recognizes “the right of researchers to publish their work in journals of their choice, because researchers are the best judges of where to publish their work.” Since at least 2016, there has been an ongoing national initiative combat predatory journals and to support researchers in their choice of journals across higher education institutes in India. The main product of this work has been a list of approved journals in which academic researchers are permitted to publish in as well as standard templates for researchers when communicating with journals. The University Grants Commission (UGC), the regulator and funder of high education, has been leading the initiative. It is uncertain whether the country’s largest health research funders are on board due to their lack of guidance in this space. A coordinated approach by a range of stakeholder groups, which includes funders (who have innate authority to implement mandates about publishing), may facilitate improved publication decisions by researchers. Importantly, however, UGC’s list of approved journals has been plagued with numerous credibility concerns in its short existence. Explicit recommendations from India’s funders regarding credible and non-credible features of journals in which to publish may be warranted in the absence of a trusted and comprehensive list.

**Facilitating and monitoring adherence to funder policies.**

Funders are well-positioned to provide researchers with resources and tools to help ensure that results from funded research are published in credible and discoverable journals, in line with their policies. Several organizations in our sample consistently offer more information about potential publishing routes and tools to facilitate adherence to their policies. We provide a list of tools to facilitate the development of funder policies on research outputs, adherence to such policies, and monitoring of policy adherence (Table 8).

Monitoring researchers’ adherence to their policies may help funders understand the extent to which researcher’s publishing practices are guided by their policies. Informing researchers that their adherence to open access policies is being monitored may facilitate better awareness of such policies and potentially increase adherence to them. A 2018 study examining the accessibility of research supported by 12 research funding agencies across North America and Europe with open access policies, found that 62% of almost 1.3 million articles over nine years were freely available. In 2016, 90% of published research supported by the NIH and Wellcome Trust was free to access (via journal, repository, or both). Both agencies mandate the deposit of published research by publishing journals or funded authors into dedicated repositories (PMC for NIH; PMC Europe for Wellcome Trust). The remaining 10 funders in the sample did not mandate depositing in a repository alongside publication and had lower rates of freely accessible articles. For example, for the Canadian Institutes of Health Research (CIHR) only 55% of published research was freely accessible in 2016, even though the funder had a dedicated repository (PMC Canada) until 2018 (it closed due to low usage and high upkeep costs). The study’s authors conclude that funders with low compliance rates used less enforcement and had less infrastructure to support compliance with their open access mandates.

**Areas of future research**

An important area of future study is whether researchers are being funded on the basis of grant applications that include research published in predatory journals – or in journals that may not be indexed in trusted databases. Predatory journals have made their way into consideration (via CVs submitted by researchers or through institution-initiated database searches) into applications for academic career advancement. Some have called for such publications to either be discounted from consideration or for researchers who submit them for consideration to be prevented from career advancement. It is unknown whether researchers are including publications in predatory journals as part of their funding applications. This should be evaluated. If they are, funders may wish to consider whether this is an important consideration for awarding funding.

**Conclusion**

Most large health research funders mandate open access to funded research outputs, typically by way of open access journal publication and by deposition of published research in digital repositories. Few funders provide guidance on what constitutes a journal (or an open access journal) or are checking to ensure that published research that they have funded is indeed meeting specified requirements about how research should be shared. Health research funding organizations have an obligation to support researchers in meeting their mandates so that research can, as intended, contribute to the broader evidence base. The publishing community needs to provide guidance to funders and researchers on universally acceptable and transparent standards for journal operations. Many solutions to improve policies, facilitate adherence, monitor compliance and work with other funders on large-scale improvements exist and should be implemented.

Journals that fail to make research discoverable breach the basic trust that researchers and their funders have in the current publishing system. Most funded researchers publish their work under the basic assumption that their journal or publisher is following best practices to ensure future use. Bodies funding health research have a responsibility to protect their investments and even more importantly, to ensure that funded research is not wasted by being published in non-credible and non-discoverable sources.

Acknowledgements
We would like to thank Dr. Beverley Holmes of the Michael Smith Foundation for Health Research for providing valuable insight into global health research funder operations and policies at the outset of this project.

Author contributions

The study was conceived of by LS, JG, and DM. LS drafted the initial protocol, with approval from the study team. LS managed the research project. LS, KDC, and MJP carried out the research. LS cleaned and analysed the data, prepared tables and figures, and drafted the manuscript. All authors provided feedback and gave their approval prior to submission.

Many thanks to the authors for their consideration of my review and their revisions. While many of my comments were addressed, I do have some additional feedback based on the responses from the authors that I believe should be further considered. That said, these are all relatively minor enough that I recommend the manuscript move forward for indexing as the analysis and related discussion is overall fundamentally sound.

-As indicated, Dr. Holmes is the CEO of a health research funding organization (not included in our sample). Her expertise of the funding landscape and whether a listing of health research funders existed or whether the chosen list was the best source of this information, was an invaluable methodological contribution to our research. We prefer not to remove this acknowledgment.

I still believe this reads awkwardly in the text and is not how personal communication citations are typically used. If it is just an acknowledgement it is ultimately redundant to your thanks of Dr. Holmes in the “Acknowledgements” section at the end of the piece. However this is a minor point.

-Extraction criteria were devised de novo based on expertise within the author team. There is no reference standard for funder policies about publishing and as such we did not use any framework for extraction. We have added a clarification of this point in the methods section rather than in the discussion section.

The addition to the methods is appropriate although I do believe there is an argument to be made that using criteria developed in-house based on expertise, while an acceptable method, could be seen as a limitation as it is lacking further validation and consideration beyond the study team.

-We did not apply an analytical framework to the extracted text and doing so would be a post-hoc analysis. The table/text is provided for reference/transparency of extracted data.
summarized in Tables 2-4. We do not feel that a summary is necessary.

I do not agree that a full analytic framework is required to condense multiple tables of raw verbatim text within the body of a manuscript into something more easily digestible to readers. I still strongly recommend that the authors reconsider the utility that 7 pages of Tables in the middle of the manuscript (including 4 pages just for Table 5) has for readers when Tables 2-4 summarize the extractions from this raw data as necessary for the endpoints considered and interested parties could examine the very well-curated, transparent, and clearly sign-posted raw data for themselves as necessary.

-To be clear, we did not make a post-hoc justification regarding the lack of outreach to funders. We specifically did not have the a priori intent of verifying our data with funders. We anticipated that the results of our previous work, https://www.nature.com/news/stop-this-waste-of-people-animals-and-money-1.22554, which identified a large number of funders supporting research in predatory journals, may impact/prompt changes in funder policies once published (Sept 2017). Due to the timing of the current study, (Aug – Sept 2017), we decided not to engage funders since we did not want to influence any potential changes to their policies as a result of the study process. We did not find this to be a limitation. As expected, and as noted in our discussion, we are aware of at least one funder (NIH) who, in Nov 2017, clarified their policies about publication as a result of the previous study. The specific impacts (i.e., number and type of clarifications) of engaging funders to clarify extracted data in Goldacre et al's previous work are unclear, however, we have added text to the limitations section outlining the additional potential benefit of engaging funders in the study process.

While it is true that outreach to sponsors was not specified in the protocol, it is also true that the justification for not doing so was also not provided in the protocol despite the fact that it was used in the study cited as informing your data collection/extraction methods. Therefore, while the decision not to conduct outreach was not post hoc there is no way to know if the provided justification was or not. In my original reading the provided information was not well-supported by even your own findings. Expanding on the context provided above in your revision is helpful however there is another aspect at play here. You relied on a single author for searches and only involved a second party for extractions. There is no acknowledgement of the potential that documents could have been missed by a single searcher. Outreach to the parties under investigation would allow them to confirm whether or not you have missed potentially relevant documentation on the topics of interest. It is a validation step for your methods rather than simply a way to potentially increase “uptake of our findings/recommendations into practice.”

**Competing Interests:** No competing interests were disclosed.

**Reviewer Expertise:** Metascience, health policy, publication ethics.

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.
Many thanks for the opportunity to review this piece on health research funders’ policies on journal selection for research outputs.

Overall, this piece investigates an interesting topic, has appropriate methods, appears well-executed, and follows open science best principles of pre-registration and open sharing of data for which it should be commended. I ultimately believe it should be recommended for indexing but a minor revision is in order. Specific points are provided below.

Can the authors please revisit the piece for a bit of editing? The informational content all appears very relevant and well-researched but the prose can carry on at times and structurally it jumps back and forth between topics and it is difficult to connect the threads. This is most applicable to the introduction (and perhaps the Discussion as well) but I think taking a critical eye towards developing a more direct, succinct, and straightforward writing style throughout would enhance readability. A sharper consolidation and organisation of your ideas and arguments, while trying to be more concise overall, will aid readers considerably. A brief example: “Funders ought to be concerned that funded research may be published in journals that do not ensure discoverability of content ensuring it is available to contribute to future science” could surely be consolidated to something like “Funders should ensure published research is discoverable to the scientific community.”

One area that doesn’t really come through clearly in the Intro is what funders get out of publication of their funded work and how this influences this dynamic. Why are they moving towards Open Access? What about other dissemination routes?

The personal communication citation of Dr. Beverly Holmes feels a bit out of place. Is she merely stating an opinion? If so, why can the authors not just state this opinion directly themselves since I assume they share it? I’m sure Dr. Holmes is perfectly knowledgeable and her opinion is valuable, but is citing her necessary here? I’m most familiar with citations of personal communication to convey official information not published elsewhere, from a direct source, rather than simply used to state an opinion the authors agree with. The average reader won’t have any insight as to why they should trust the word of Dr. Holmes on this issue.

The link to the protocol is upfront and clear and points readers to exactly where they can easily access more detailed information about the search/data extraction methods. Very well done by the authors.
How were the extraction criteria derived? Did the authors base them on anything or did they come up with them de novo? This should be stated and potentially explored in the Discussion.

One major area I was surprised that the authors did not include in their assessments is whether the funder offers to pay the open access/APCs of work they fund. This would be an important part of the dynamic of how, where, and why certain journals may be chosen and why funders should care even more about where the research they fund ends up.

In Figure 1, it is unclear when INSERM is mentioned as to whether that is the funder being removed or the reason another funder is being removed (later context shows it's the latter, but this is unclear). Also there is a type (“allocated”) in the “Excluded Funders n=6” box. I think ideally you would list which exact funders are entering or exiting the sample in this figure for clarity as you don't get a good sense of what funders are actually being assessed until the results. It's also not necessary to restate in prose everything Figure 1 already conveys (something to be cognisant of throughout).

Table 5 is a bit overwhelming. Perhaps consider summarising each policy in Table 5 and make the full text extractions available as an appendix for interested readers.

I don't find the reason given for a lack of outreach to sponsors particularly compelling. The author's state they did not verify with sponsors (despite this being a feature of the work from Goldacre et al. they cite as a template for this research) because “data collection took place at a time when the publishing activities...was rapidly changing.” That seems like a post hoc justification rather than an actual reason why it didn't actually occur. It also isn't supported by their own data as the median date of effect of policies reported was September 2014, 3 years prior to data collection and the higher IQR range is April 2016, over a year before the searches. Similarly, this article is cross-sectional, so I don't see that reason as relevant anyway. You could simply have discarded policies from before a cutoff date, etc. Can the authors please revisit their discussion of this limitation?

Table 8 may fit better in an appendix.

**Is the work clearly and accurately presented and does it cite the current literature?**
Partly

**Is the study design appropriate and is the work technically sound?**
Yes

**Are sufficient details of methods and analysis provided to allow replication by others?**
Yes

**If applicable, is the statistical analysis and its interpretation appropriate?**
Yes

**Are all the source data underlying the results available to ensure full reproducibility?**
Yes
Are the conclusions drawn adequately supported by the results?
Yes

**Competing Interests:** No competing interests were disclosed.

**Reviewer Expertise:** Metascience, health policy, publication ethics.

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard, however I have significant reservations, as outlined above.

Author Response 01 Apr 2021

Larissa Shamseer, University of Ottawa, Ottawa, Canada

Thank you for reviewing this work. Please see responses to your comments below.

- We have made some changes in the introduction and discussion sections to make the wording more concise.
- We have clarified that scholarly publishing is intended to facilitate the discoverability and uptake of funded research (into practice) and that predatory journals limit this by having unreliable discovery and questionable trustworthiness. We did not set out to investigate funders’ open access (OA) policies or shifts towards OA since discoverability and other journal features compromised by predatory journals can be achieved independent of openness. We note that several sources (ROARMAP, SHERPA JULIET) list details of funders’ open access policies. This research is instead concerned with hallmarks of journal validity which have been (mis)taken as signals of research quality.
- Regarding other dissemination routes, we have clarified that this research focuses on journal publications rather than other publications routes (end of introduction section).
- As indicated, Dr. Holmes is the CEO of a health research funding organization (not included in our sample). Her expertise of the funding landscape and whether a listing of health research funders existed or whether the chosen list was the best source of this information, was an invaluable methodological contribution to our research. We prefer not to remove this acknowledgment.
- Extraction criteria were devised de novo based on expertise within the author team. There is no reference standard for funder policies about publishing and as such we did not use any framework for extraction. We have added a clarification of this point in the methods section rather than in the discussion section.
- We have added text to the introduction (2nd para) outlining the waste of research funds & APCs due to predatory journals. While we did not extract specific data on funders’ APC provisions, where funders provided information about journal APC support, this can be found in Table 5.
- We have updated the suggested information in the flow diagram and left the related descriptive text in results for additional reference.
- We did not apply an analytical framework to the extracted text and doing so would be a post-hoc analysis. The table/text is provided for reference/transparency of extracted data summarized in Tables 2-4. We do not feel that a summary is necessary.
To be clear, we did not make a post-hoc justification regarding the lack of outreach to funders. We specifically did not have the *a priori* intent of verifying our data with funders. We anticipated that the results of our previous work, https://www.nature.com/news/stop-this-waste-of-people-animals-and-money-1.22554, which identified a large number of funders supporting research in predatory journals, may impact/prompt changes in funder policies once published (Sept 2017). Due to the timing of the current study, (Aug – Sept 2017), we decided not to engage funders since we did not want to influence any potential changes to their policies as a result of the study process. We did not find this to be a limitation. As expected, and as noted in our discussion, we are aware of at least one funder (NIH) who, in Nov 2017, clarified their policies about publication as a result of the previous study. The specific impacts (i.e., number and type of clarifications) of engaging funders to clarify extracted data in *Goldacre et al*'s previous work are unclear, however, we have added text to the limitations section outlining the additional potential benefit of engaging funders in the study process.

F1000 does not allow appendices and we have opted not to move this table to the Open Science Framework repository for this project as supplementary materials. We feel that the recommendations in this table are part of our discussion and are likely to receive little uptake if readers have to navigate away from the full text.

**Competing Interests:** No competing interests were disclosed.

2 Centre for Publication Ethics, Savitribai Phule Pune University, Pune, Maharashtra, India

The purpose of this work is clear and the work is explicitly and precisely presented. Researchers would like to describe the policies of major health research funding agencies. The job is sound technically.

Authors selected policies from 44 funding agencies and assessed systematically to find information and recommendations on the dissemination of research output, recommendations on criteria for the selection of journals (quality, impact factor and other metrics).

Methodology for data collection and analysis is discussed very well and the protocol followed is described in detail.
Statistical data can be interpreted easily. Source data can be reproducible.

The results obtained through this exercise are well discussed and will be of interest to all funding agencies, especially those from developing countries. The findings of the study show that there is no specific guidance about how to select a journal for publication. The mention and cautionary notes on predatory publishers and their open-access nature should be made clear by these funding agencies. Authors warned policymakers about this. If the policy of these funding agencies advises researchers to current trends in publishing, researchers may not fall into pray with predatory publishers.

Overall, this work is recommended for indexing. Similar studies can be considered for the assessment of policies of funding agencies other than health research funders.

Is the work clearly and accurately presented and does it cite the current literature?
Yes

Is the study design appropriate and is the work technically sound?
Yes

Are sufficient details of methods and analysis provided to allow replication by others?
Yes

If applicable, is the statistical analysis and its interpretation appropriate?
Yes

Are all the source data underlying the results available to ensure full reproducibility?
Yes

Are the conclusions drawn adequately supported by the results?
Yes

Competing Interests: No competing interests were disclosed.

Reviewer Expertise: Bibliometrics, publication ethics, institutional repositories.

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.
